Teacher Performance Dashboard

Attendance, Workload, and Compensation Insights

REPORTING PERIOD	1 September 2025 – 22 April 2026
PREPARED FOR	Academic Operations & HR Stakeholders
PREPARED BY	Analytics & Reporting Team

About this report

This document translates the live Power BI dashboard into a narrative briefing for stakeholders who need the headline numbers, the story behind them, and a clear set of next steps — without opening the dashboard itself.

1. Executive Summary

This report covers the Teacher Dashboard built in Power BI, which monitors teacher attendance, average class load, subject-wise compensation, and payroll processing status across all teachers, boards, and classes for the period 1 September 2025 to 22 April 2026. The objective of this dashboard is to give academic operations and HR a clear, filterable picture of teaching capacity utilization and payout health, so that staffing decisions are based on observed workload rather than anecdote.

During this period, teacher attendance averaged 80.16%, with each teacher conducting an average of 3.00 classes and generating an average revenue of ₹1.67K per teacher. Payroll status data shows that just over half of all payment records are settled (Paid at 53.4%), while a meaningful 41.4% combined share remains Pending, On Hold, or in Processing — a useful early-warning signal for payroll bottlenecks before they reach individual teachers as complaints.

This report walks through attendance and workload distribution, subject-wise compensation, the teacher-subject mapping that underlies scheduling, and payroll health, before closing with prioritized HR and academic-operations recommendations.

2. Key Performance Indicators

The metrics below are drawn from the dashboard's summary cards and the payroll status donut chart, both filterable by board, class, fee status, and class date.

80.16% Teacher Attendance Rate	3.00 Avg Classes Per Teacher	₹1.67K Avg Revenue Per Teacher
53.4% Payroll: Paid	19.2% Payroll: Pending	13.7% Payroll: On Hold
8.5% Payroll: Processing	~5% Payroll: Cancelled	

How to read this scorecard

Attendance Rate and Avg Classes Per Teacher should be read together: a high attendance rate with a low average class count can still mean teachers are underutilized rather than simply reliable. The payroll donut is best read as two groups — the 53.4% that is fully resolved (Paid)

versus the 41.4% still moving through the pipeline (Pending + On Hold + Processing) — since that second group is where HR attention is most needed.

3. Attendance & Workload Distribution

Teacher attendance is tracked overall and can be filtered by board, class, fee status, and date range. An 80.16% attendance rate is a solid baseline for a growing institute, but the 'Avg Classes by Teacher' chart shows a wide spread — a small group of teachers (led by Rohit Malhotra, Suresh Kumar, and Mihir Gulati) carries a disproportionately high average class load compared to the rest of the staff, several of whom sit well below the 3.00 average.

3.1 Workload Tiers

Tier	Approx. Avg Classes	Representative Teachers	Implication
High Load	8–11+	Rohit Malhotra, Suresh Kumar, Mihir Gulati	Burnout and single-point-of-failure risk.
Mid Load	5–7	Mishika Sharma, Sashank Mehta, Deepak Yadav	Healthy utilization; good scheduling buffer.
Light Load	1–4	Most remaining teaching staff	Underutilized capacity available for rebalancing.

Insight: Workload Concentration

A handful of teachers are averaging significantly more classes than their peers, while many others cluster near the lower end of the distribution. This imbalance creates burnout risk for high-load teachers and underutilization risk for the rest — both are worth addressing through scheduling rebalancing rather than simply hiring additional staff.

It is worth noting that 'Sum of Total Classes by Teacher' tells a partially different story than 'Avg Classes by Teacher' — teachers such as Shilpa Agarwal and Nitin Bansal lead on total volume even though they may not top the per-teacher average, which usually reflects a longer active tenure within the period rather than a heavier weekly load. We recommend always pairing the average and total views before drawing staffing conclusions.

4. Subject-Wise Compensation

The 'Sum of Teacher Hourly Rate by Subject' view shows Mathematics, English, and Physics commanding the highest aggregate hourly-rate totals, consistent with their higher class volumes and the larger number of teachers assigned to these subjects. Subjects like Sociology and BST sit at the lower end, reflecting both lower student demand and fewer assigned teaching hours.

4.1 Teacher–Subject Mapping (Sample)

The dashboard's detail table maps every teacher to the subjects they are scheduled to teach. A sample is shown below; the full table is filterable live in the dashboard.

Teacher	Subject(s)
Abhishek Routela	Accounts, BST, Economics, Mathematics
Deepak Yadav	Biology, Physics
Chirag Raghuvanshi	BST
Kanishka Sharma	BST
Manoj Tiwari / Meenakshi Iyer / Komal Sethi	Science
Amit Sharma / Arju Sharma / Harish Arora	Mathematics

Several teachers are mapped across multiple subjects, which is efficient for scheduling flexibility but should be monitored to ensure subject-matter depth is not stretched too thin, particularly for core board-exam subjects such as Mathematics and Science where consistency of teaching style matters for student outcomes.

5. Payroll Health

The payment-status breakdown (Paid 53.4%, Pending 19.2%, On Hold 13.7%, Processing 8.5%, Cancelled the remainder) gives HR a real-time payroll pulse rather than a month-end surprise. The combined Pending and On Hold share — roughly a third of all payroll records — is the segment most likely to generate teacher dissatisfaction if not resolved promptly, since these are amounts teachers are actively expecting.

5.1 Payroll Status Definitions

Status	Definition	Typical Cause
Paid	Payment fully disbursed to the teacher.	Standard monthly cycle completed.

Pending	Payment due but not yet initiated.	Awaiting monthly payroll run.
On Hold	Payment paused pending review.	Discrepancy in class count or rate.
Processing	Payment initiated but not yet settled.	Bank/processing turnaround time.
Cancelled	Payment voided.	Class cancellation or data correction.

6. Recommendations

- Rebalance class assignments away from the small group of highest-load teachers toward underutilized staff to reduce burnout and improve scheduling resilience.
- Investigate the root cause of On Hold and Processing payroll statuses, which together represent roughly a fifth of all payments, and set an internal SLA (e.g., 5 business days) for resolution.
- Review hourly-rate structures for high-demand subjects (Mathematics, English, Physics) to ensure compensation keeps pace with class volume and market rates.
- Use the attendance filter by board and class to identify whether attendance dips are concentrated in specific boards, enabling targeted intervention rather than institute-wide policy changes.
- Establish a quarterly teacher-workload review using this dashboard as the single source of truth for HR and academic planning, with the workload-tier table above as the starting checklist.
- Cross-reference single-subject teachers (e.g., those teaching only BST or only Sociology) against student demand trends to right-size hiring for low-volume subjects.

7. Conclusion

The Teacher Dashboard turns previously siloed attendance, scheduling, and payroll data into one governed view. With workload rebalancing and tighter payroll SLAs, this dashboard can directly support teacher retention and more predictable academic delivery. We recommend reviewing it monthly alongside the Admin and Student dashboards, since workload and payroll issues here often explain attendance and engagement patterns seen elsewhere.

Appendix: Glossary of Terms

Term	Definition
Avg Classes Per Teacher	Mean number of classes conducted per teacher within the selected filter range.
Teacher Hourly Rate	Contracted per-hour compensation rate for a given teacher-subject combination.
Payroll Status	Current stage of a teacher's monthly payment in the disbursement pipeline.
Workload Tier	Internal grouping (High / Mid / Light) used in this report to describe class-load distribution.
